

Now 50 % discount on a transport data logger MSR175plus

Dear customer

Sensitive and valuable goods are exposed to a variety of risks on their way to the customer. Whether on the road or rail, on water or in the air – there is a threat of impact and tilt events both in the loading situations and on the way to the destination. Likewise, extreme or fluctuating environmental conditions can damage your transport goods.

For transport monitoring and packaging optimisation: [MSR175plus data logger](#)

Documenting transport events is not only a prerequisite for quickly clarifying liability and insurance issues in the event of damage, it also allows early detection of transport damage.

MSR175plus: simultaneous shock detection ± 15 g and ± 200 g, temperature, air pressure, humidity, light, GPS/GNSS position data

The MSR175plus acts like a "black box", using sensors to detect critical events and GPS and time stamp to record their position. The special feature of the MSR175plus: shocks are detected **simultaneously with a ± 15 g and a ± 200 g acceleration sensor**. The memory is sufficient to record data for days or months. After transport monitoring has been completed, the battery can be removed if necessary, which may be relevant for returning the data logger depending on country-specific regulations. The recorded transport data can be read out via USB. Using the evaluation software, conspicuous events can be quickly analysed and documented as evidence.

The recorded measurement data is indispensable for clarifying liability and insurance issues in the event of transport damage and also helps to optimise packaging.

50 % demo discount on an MSR175plus transport data logger

Only 1 MSR175plus per customer/company may be sold at the 50 % discount, as it is intended to be a get-to-know offer.

Offer valid until 24 December 2021. Discount cannot be cumulated with other promotions.
